IP Sound system software
GGM IPASOFT

The sound system software is a central element of the installation. It can manage the integrality of the project configuration as well as exchanges between the equipment. It provides overall supervision of the installation with online equipment status via an emap. It is possible to easily define the zones and to modify them in several clicks. Each stream can be prioritised. You can also recover the flow coming from the PC in order to reintegrate it into the network. It is possible to plan the tasks and manage priorities. With regards to the server, you can manage product configurations. Manage task planning. Create media libraries Manage priorities Record the exchanges coming from the microphone towards the intercoms or loudspeakers Supervise the installation via the emap or the management menu Create and manage zones Trigger alarm scenarios manage users With regards the client, manage playlist diffusion locally Encode the flow coming from the client PC Visualise the equipment status Visualise current tasks Initiate mono and bi-directional communication with the equipment
